# 1.Introduction

## 1.1 Project Overview

IoT-based farming systems help farmers to monitor various parameters of their fields, such as soil moisture, temperature, and humidity, using several sensors. A farmer can monitor all sensor parameters through his web or mobile application without being near his field. Crop irrigation is one of the most important tasks for a farmer. By monitoring sensor parameters and controlling motor pumps from a mobile application, irrigation or crop movement decisions can be made easily.

## 1.2 Purpose

Better production management leads to a better cost control and less waste. For example, the ability to eliminate abnormal animal health conditions helps eliminate the risk of yield loss. In addition, automation increases efficiently. Smart Farming forms the ecological base of faming. Minimizing the site-specific application of inputs such as fertilizers and pesticides in precision farming systems reduces leaching issues and digester gas emissions.

# 2.Literature Survey

## 2.1 Existing Problem

IoT's Smart Farming improves entire farming systems by monitoring fields in real time. With the help of sensors and internet connectivity, the Internet of Things in culture has not only saved the celebrity era, but has also encouraged the abuse of resources such as water and electricity. Climate plays a very important role in agriculture. Mis-knowledge of climate also significantly reduces the quantity and quality of crop production. Precision agriculture/precision farming is one of his best known applications of IoT in agriculture. It enables smart farming applications such as livestock monitoring, field observation, and inventory monitoring, making farming practices more precise and controllable. To make greenhouses smart, IoT has enabled weather stations to automatically adjust climate conditions according to a specific set of instructions. IoT implementation in the greenhouse eliminated human intervention, making the whole process more cost-effective and more accurate.

## 2.2 References

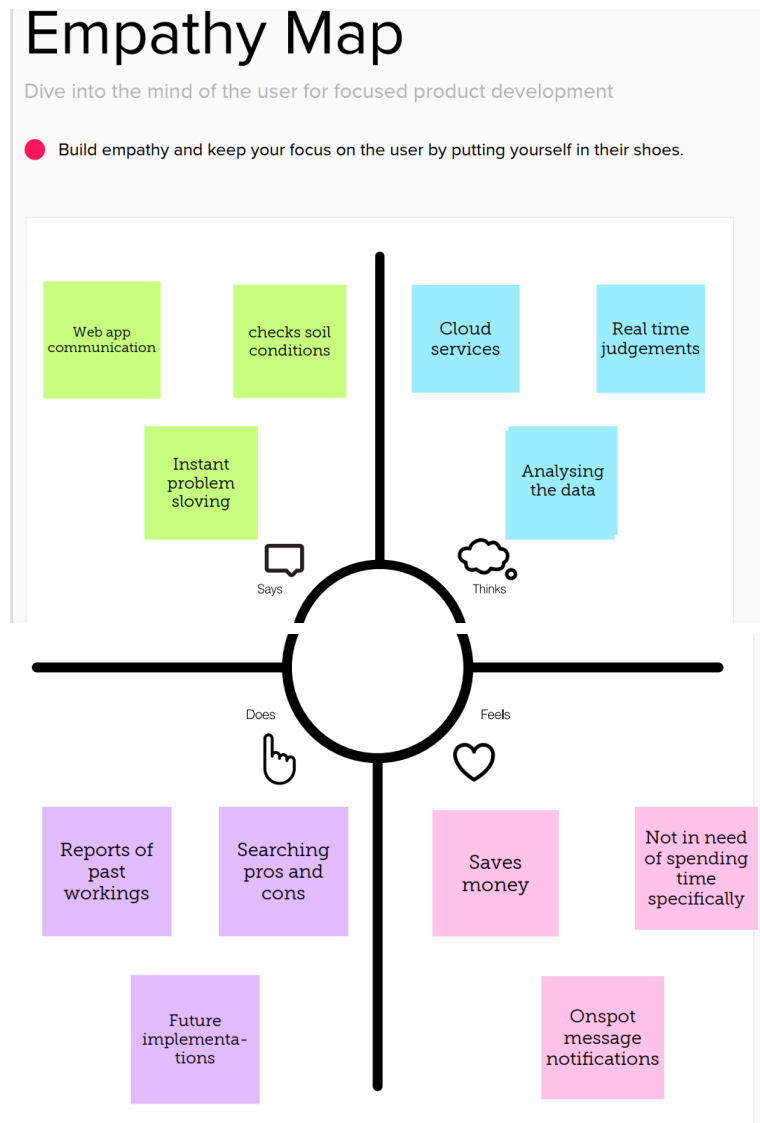

1. Internet of Things in agriculture, recent advances and future challenges Antonis Tzounisa, Nikolaos Katsoulasa, Thomas Bartzanas, Constantinos Kittasa a Department of Agriculture Crop Production & Rural Environment, University of Thessaly, Volos, Greece b Institute for Research & Technology – Thessaly, Centre for Research and Technology – Hellas, Volos, Greece Received 18 March 2017, Revised 2 September 2017, Accepted 21 September 2017, Available online 24 November 2017, Version of Record 24 November 2017.
2. Divya J., Divya M., Janani V. [2] Agriculture is essential to India's economy and people's survival. The purpose of this project is to create an embedded-based soil monitoring and irrigation system that will reduce manual field monitoring and provide information via a mobile app. The method is intended to help farmers increase their agricultural output. A pH sensor, a temperature sensor, and a humidity sensor are among the tools used to examine the soil. Based on the findings, farmers may plant the best crop for the land.
3. Kittikhun Meethongjan, Suwit Kongsong. The smart agriculture system played with an automation system and monitoring system based on wireless sensor networks. It can collect data from different sensors deployed at various nodes and sends it through the wireless protocol. In smart agriculture, Arduino mainboard of IOT system consists of temperature sensor, moisture sensor, water level sensor, DC motor and GPRS module.

## 2.3 Problem Statement Solution

To provide efficient decision support system using wireless sensor network which handle different activities of farm and gives useful information related to farm. Information related to Soil moisture, Temperature and Humidity content. Due to the weather condition, water level increasing Farmers get lot of distractions which is not good for Agriculture. Water level is managed by farmers in both Automatic/Manual using that mobile application. It will make more comfortable to farmers. Performing agriculture is very much time consuming. Traditional agriculture and related sectors are unable to meet the demands of modern agriculture, which requires high yield, quality and efficient production. Therefore, it is very important to look to modernize existing methods and use information technology and data over a period of time to predict the best possible productivity and country-suitable crops. The introduction of high-speed internet, mobile devices, and access to reliable and low-cost satellites is just some of the key technologies characterizing the precision farming trend in agriculture. Precision agriculture is one of his best-known applications of IoT in the agricultural sector, with many organizations around the world using the technology. Products and services used include VRI Optimization, Soil Moisture Probes and Virtual Optimizer PRO. Optimize variable rate irrigation (VRI) to maximize profitability, improve yields and increase water efficiency in irrigated fields with variable terrain and soils. IoT is making great strides in areas such as manufacturing, healthcare, and automotive. When it comes to food production, transportation and storage, it offers a range of options to improve his per capita food availability in India. Sensors that provide information on soil nutrient status, pest infestation, moisture conditions, etc. can be used to improve crop yields over time.

# 3. Ideation & Proposed Solution

## 3.1. Prepare Empathy Map

## 3.2 Ideation

### Brainstorm & idea prioritization

Use this template in your own brainstorming sessions so your team can unleash their imagination and start shaping concepts even if you're not sitting in the same room.

- 10 minutes to prepare
- 1 hour to brainstorm
- 2-3 people recommended

**Before you collaborate**

A little bit of preparation goes a long way with this session. Here's what you need to do to get going.

- 1. Have gathering: Gather your virtual participants in the session and send an invite. Share relevant information as you work ahead.
- 2. Set the goal: Think about the problem you'll be focusing on solving in the brainstorming session.
- 3. Learn how to use the facilitation tools: Use the Facilitation Superpowers to run a happy and productive session.

**Define your problem statement**

What problem are you trying to solve? Frame your problem as a how might we statement. This will be the focus of your brainstorm.

**PROBLEM**

1) To increase the number of young farmers by motivating young people to continue, return to, or enter farming to replace older farmers. 2) To help young farmers to become agricultural leaders in their communities, and 3) To create collaborative networks among relevant stakeholders for the development of the agricultural sector of the country.

**Key rules of brainstorming**

The most useful and productive session

- Stay on topic
- Encourage wild ideas
- Defer judgment
- Listen to others
- Go for volume
- If possible, be visual

**Brainstorm**

Write down any ideas that come to mind that address your problem statement.

**Key**

You can select a sticky note and fill the second column in, which is not the main board.

**KEYWORDS**

**IDEAS**

**NOTES**

**FEEDBACK**

**Board view**

How a board looks when it's shared in a meeting room.

**Sticky notes**

How a board looks when it's shared in a meeting room.

**Group ideas**

Take turns sharing your ideas while clustering similar or related notes as you go. In the last 10 minutes, give each cluster a sentence-like label. If a cluster is bigger than six sticky notes, try and see if you can break it up into smaller sub-groups.

10 minutes

**Key**

You can select a sticky note and fill the second column in, which is not the main board.

**Prioritize**

Your team should all be on the same page about what's important moving forward. Place your ideas on this grid to determine which ideas are important and which are feasible.

10 minutes

**Importance**

Rank ideas from most important to least important.

**Feasibility**

Rank ideas from most feasible to least feasible.

**Key**

You can select a sticky note and fill the second column in, which is not the main board.

**After you collaborate**

You can export the board as an image or pdf to share with members of your company who might find it helpful.

**Quick add-ons**

- Share the board**: Share a live link to the board with stakeholders to keep them in the loop about the outcomes of the session.
- Export the board**: Export a copy of the board as a PNG or PDF to share to email, social media, or save to your drive.

**Keep moving forward**

- Brainstorming**: Define the components of a new idea or strategy.
- Customer experience journey map**: Understand customer needs, motivations, and obstacles for an experience.
- Strengths, weaknesses, opportunities & threats**: Identify strengths, weaknesses, opportunities, and threats (SWOT) to develop a plan.

### 3.3 Proposed Solution

| S.No. | Parameter                                | Description  |
|-------|--|--|
| 1.    | Problem Statement (Problem to be solved) | To provide efficient decision support system using wireless sensor network which handle different activities of farm and gives useful information related to farm. Information related to Soil moisture, Temperature and Humidity content. Due to the weather condition, water level increasing Farmers get lot of distractions which is not good for Agriculture. Water level is managed by farmers in both Automatic/Manual using that mobile application. It will make more comfortable to farmers. Performing agriculture is very much time consuming. |
| 2.    | Idea / Solution description              | In Internet of Things based smart agriculture, a system is formed to monitor the farmland with the help of sensors, which senses components like temperature, light, humidity, soil moisture, etc. Then, automate the irrigation system and allow farmers to monitor their field conditions from anywhere through IoT Analytics Platform. To make the agricultural process even smarter and accurate, precision agriculture is used. This makes agricultural   |

|    |                      |   |
|----|----------------------|---|
|    |                      | <p>practice more controlled and precise in terms of raising livestock and farming. The output of the solution will be in the form of an application which gives us the above mentioned features like displaying the temperature, humidity, soil moisture which enables the farmers to know about the exact condition of the soil.</p>   |
| 3. | Novelty / Uniqueness | <p><b>Monitoring Soil Quality:</b></p> <p>Farmers usually use a sampling method to calculate soil fertility, moisture content. Thus, this sampling doesn't give accurate results as chemical decomposition varies from location to location. Meanwhile, this not much helpful. To resolve this thing, it plays an essential role in Farming. Sensors can be installed at a uniform distance across the length and breadth of the farmland to collect the accurate soil data, which can be further used in the dashboard or mobile application for the farm monitoring.</p> <p><b>Smart Irrigation on Agriculture Land</b></p> <p>In smart irrigation, automated sprinkler systems or intelligent pumps are used. Soil moistures sensors are used in different areas to get the moisture of the soil in agricultural land. Based on the results from the soil moisture sensors, the intelligent pumps or intelligent sprinklers are turned On/Off.</p> |

|    |                                       |   |
|----|---------------------------------------|---|
|    |                                       | <p><b>Weather Monitoring</b></p> <p>Weather plays a very significant role when it comes to the Agriculture sector. In agriculture, there is almost everything dependable upon the climate condition. In smart Farming, temperature humidity, light intensity, and soil moisture can be monitored through various sensors. These are again used by the reactive system to trigger alerts or automate the process such as water and air control.</p> <p>Thus, the data collected from these sensors are sent to the app where it can be used for analysing and decision-making.</p> |
| 4. | Social Impact / Customer Satisfaction | <p>Smart Farming has enabled farmers to reduce waste and enhance productivity with the help of sensors (humidity, temperature, soil moisture) and automation of irrigation systems. Further with the help of these sensors, farmers can monitor the field conditions from anywhere. Internet of Things based smart Farming is highly efficient when compared with the conventional approach. Thus this application helps the farmers to save time, reduce the work.</p>   |
| 5. | Business Model (Revenue Model)        | <p>By using this application farmers can overcome the over usage and under usage of water, fertilizers, etc. With the help of</p>   |

|    |                             |   |
|----|-----------------------------|---|
|    |                             | the sensors used they get an exact notification about the humidity level, moisture content level and temperature level in the soil. This helps them to save the time and cost for labours.  |
| 6. | Scalability of the Solution | Here we use the application that gives the exact conditions of the soil and also shows the historical conditions. Once when the threshold value is low the sensors starts working and send the notification to the farmer. It is also used to detect seasonal variations as climate plays a major role in agriculture. This application works best for farmers who do farming as a full time job. |

## 3.4 Proposed Solution Fit

Project Title: Smartfarmer - IoT Enabled Smart Farming Application

Project Design Phase-I Solution Fit

Team ID: PNT2022TMD01763

# 4. Requirement Analysis

## 4.1 Functional Requirement

| FR No. | Functional Requirement (Epic) | Sub Requirement (Story / Sub-Task)  |
|--------|-------------------------------|---|
| FR-1   | User Registration             | Registration through Gmail<br>Registration by creating a new user name and password   |
| FR-2   | User Confirmation             | Confirmation via Email<br>Confirmation via OTP  |
| FR-3   | User login                    | Login using the credentials we have used during registration  |
| FR-4   | User permission               | <b>Smart Farming with IoT</b> relies increasingly on smart technology for the management of agricultural enterprises. And it does so in order to increase the quality and quantity of the products. |
| FR-5   | Using the intelligent system  | IoT and AI solutions can get integrated into autonomous tractors to help collect real-time data about soil health, including water levels, temperature, and weather.                                |

## 4.2 Non-Functional Requirements

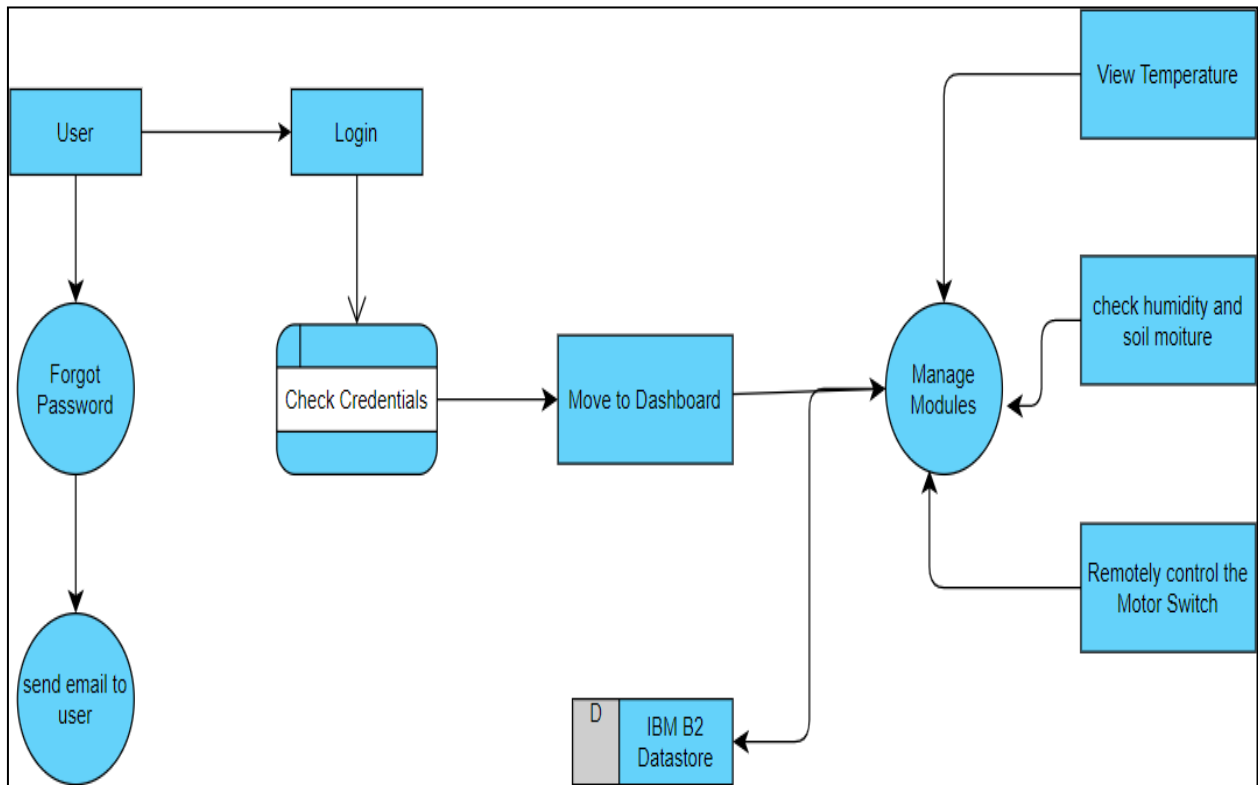

| <b>FR No.</b> | <b>Non-Functional Requirement</b> | <b>Description</b>  |
|---------------|-----------------------------------|---|
| NFR-1         | <b>Usability</b>                  | It is very user friendly, any people with less knowledge also can easily understand.Remote Management. With farms being located in far-off areas and distant lands, farmers enable this for better solution.                |
| NFR-2         | <b>Security</b>                   | Smart farming, which involves the application of sensors and automated irrigation practices, can help monitor agricultural land, temperature, soil moisture, etc. This would enable farmers to monitor crops from anywhere. |
| NFR-3         | <b>Reliability</b>                | It has good consistency and Accuracy as it actively helps farmers to better understand the important factors such as water level,weather,humidity and soil mositure.  |
| NFR-4         | <b>Performance</b>                | The performance of smart farming is high and it is very efficient as it is very easy to understand and has a high security and scalability.   |
| NFR-5         | <b>Availability</b>               | This smart farming is enabled at any system like laptop , mobile phone , desktop, Gis and user friendly.  |

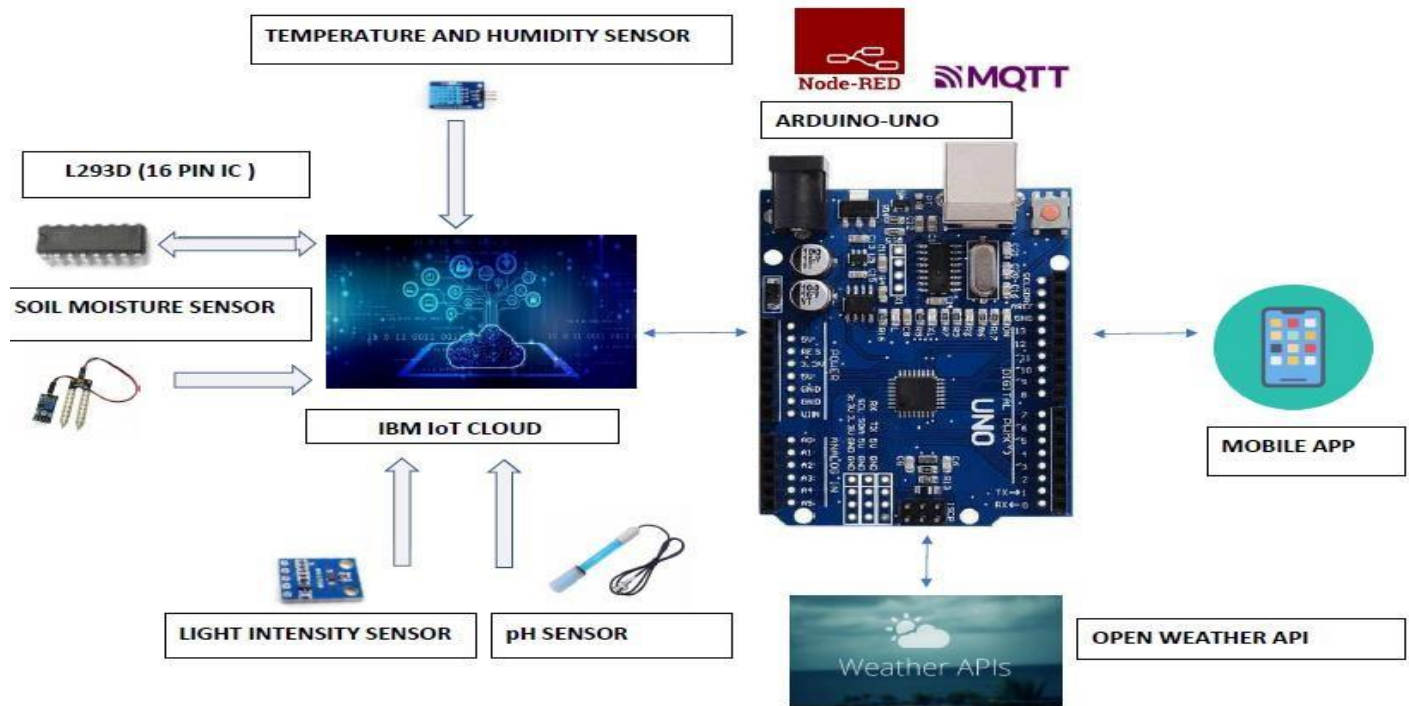

|       |                    |   |
|-------|--------------------|---|
| NFR-6 | <b>Scalability</b> | smart farming refers to the adaptability of a system to increase the capacity,the number of technology devices such as sensors and actuators, while enabling timely analysis. |
|-------|--------------------|---|

# 5. Project Design

## 5.1 Data Flow Diagram

## 5.2 Solution Architecture

- The different soil parameters (temperature, humidity, Soil Moisture) are sensed using different sensors, and the obtained value is stored in the IBM cloud.
- Arduino UNO is used as a processing unit that processes the data obtained from sensors and weather data from weather API.
- Node-red is used as a programming tool to wire the hardware, software, and APIs. The MQTT protocol is followed for communication.
- All the collected data are provided to the user through a mobile application that was developed using the MIT app inventor. The user could make a decision through an app, whether to water the crop or not depending upon the sensor values. By using the app they can remotely operate the motor switch.

## 5.3 User Stories

| User Type              | Functional Requirement (Epic) | User Story Number | User Story / Task   | Acceptance criteria                                       | Priority | Release  |
|------------------------|-------------------------------|-------------------|---|---|----------|----------|
| Customer (Mobile user) | Registration                  | USN-1             | As a user, I can register for the application by entering my email, password, and confirming my password.     | I can access my account / dashboard                       | High     | Sprint-1 |
|                        |                               | USN-2             | As a user, I will receive confirmation email once I have registered for the application                       | I can receive confirmation email & click confirm          | High     | Sprint-1 |
|                        |                               | USN-3             | As a user, I can register for the application through Facebook  | I can register & access the dashboard with Facebook Login | Low      | Sprint-2 |
|                        |                               | USN-4             | As a user, I can register for the application through Gmail   | I can register & access the dashboard with Gmail Login    | Medium   | Sprint-1 |
|                        | Login                         | USN-5             | As a user, I can log into the application by entering email & password  | I can access dashboard with email login                   | High     | Sprint-1 |
|                        | Dashboard                     | USN-6             | As a user I can enter into dashboard by using navigation panel  | I can access the dashboard by using navigation panel      | High     | Sprint-1 |
| Customer (Web user)    | Registration                  | USN-1             | As a user, I can register for the web application by entering my email, password, and confirming my password. | I can access my account / dashboard                       | High     | Sprint-1 |
|                        |                               | USN-2             | As a user, I will receive confirmation email once I have registered for the web application                   | I can receive confirmation email & click confirm          | High     | Sprint-1 |
|                        | Login                         | USN-3             | As a user, I can log into the web application by entering email & password                                    | I can access dashboard with email login                   | High     | Sprint-1 |

|                         |              |       |   |   |      |          |
|-------------------------|--------------|-------|---|---|------|----------|
|                         | Dashboard    | USN-4 | As a user I can enter into web dashboard by using navigation panel                            | I can access into dashboard by using navigation panel                   | High | Sprint-1 |
| Customer Care Executive | Registration | USN-1 | As a user I can contact the customer care service through phone or mail medium                | I can receive confirmation SMS or email                                 | High | Sprint-1 |
|                         |              | USN-2 | As a user I want customer care to answer the questions related to product and services        | I can get the problem solved within a day                               | High | Sprint-1 |
|                         |              | USN-3 | As a user I want customer care to register my complaints                                      | I can receive a confirmation message stating my complaint is registered | High | Sprint-1 |
|                         |              | USN-4 | As a user I want customer care to collect and analyse consumer feedback                       | I can get the status of my feedback                                     | High | Sprint-1 |
|                         |              | USN-5 | As a user I want customer care to troubleshoot technical problems                             | I can get the problem solved within a day                               | High | Sprint-1 |
| Administrator           |              | USN-1 | As a user I want the administrator to use good working hardware                               | I can get a guarantee and warranty card                                 | High | Sprint-1 |
|                         |              | USN-2 | As a user I want the administrator to sell the product in a reasonable rate                   | I can get the cost of bill of materials                                 | High | Sprint-1 |

| Sprint-4      | 6                         | 6 Days          | 14 Nov 2022              | 19 Nov 2022                      | 20   | 6 NOV 2022                         |

### 6.3 JIRA Report

# 7. Coding & Solutioning

## 7.1 Feature - 1

### Receiving commands from IBM cloud using C++ program

```
#include "Arduino.h"
#include "dht.h"
#include "SoilMoisture.h"
#define dht_apin A0
#define organization = "mmbh4c"
#define deviceType = "smartfarmer"
#define deviceId = "smartfarmer_1"
#define authMethod = "use-token-auth"
#define authToken = "123456789"
char server[] = ORG ".messaging.internetofthings.ibmcloud.com";

char publishTopic[] = "iot-2/evt/abcd_1/fmt/json";char topic[] = "iot-
2/cmd/home/fmt/String";
char authMethod[] = "use-token-auth";char token[]=TOKEN;
char clientId[] = "d:" ORG ":" DEVICE_TYPE ":"DEVICE_ID;

const int sensor_pin = A1; //soil moistureint pin_out = 9;
dht DHT; int c=0; void setup()
{

pinMode(2, INPUT); //Pin 2 as INPUT pinMode(3, OUTPUT); //PIN 3 as OUTPUT
pinMode(9, OUTPUT); //output for pump
}

void loop()

{
```

```

if (digitalRead(2) == HIGH)

{

digitalWrite(3, HIGH);    // turn the LED/Buzz ONdelay(10000);

digitalWrite(3, LOW);    // turn the LED/Buzz OFFdelay(100);

}

Serial.begin(9600);delay(1000);

    DHT.read11(dht_apin); //tempraturefloat h=DHT.humidity;

float t=DHT.temperature;delay(5000); Serial.begin(9600);

float moisture_percentage;int sensor_analog;

sensor_analog = analogRead(sensor_pin);

    moisture_percentage = ( 100 - ( (sensor_analog/1023.00) *100 ) );

float m=moisture_percentage;delay(1000);

if(m<40)//pump

{

while(m<40)

{

digitalWrite(pin_out,HIGH);        //open pump sensor_analog =

analogRead(sensor_pin);

    moisture_percentage = ( 100 - ( (sensor_analog/1023.00) *100 ) );

m=moisture_percentage;delay(1000);

}

digitalWrite(pin_out,LOW);        //closepump

```

```

}

if(c>=0)

{

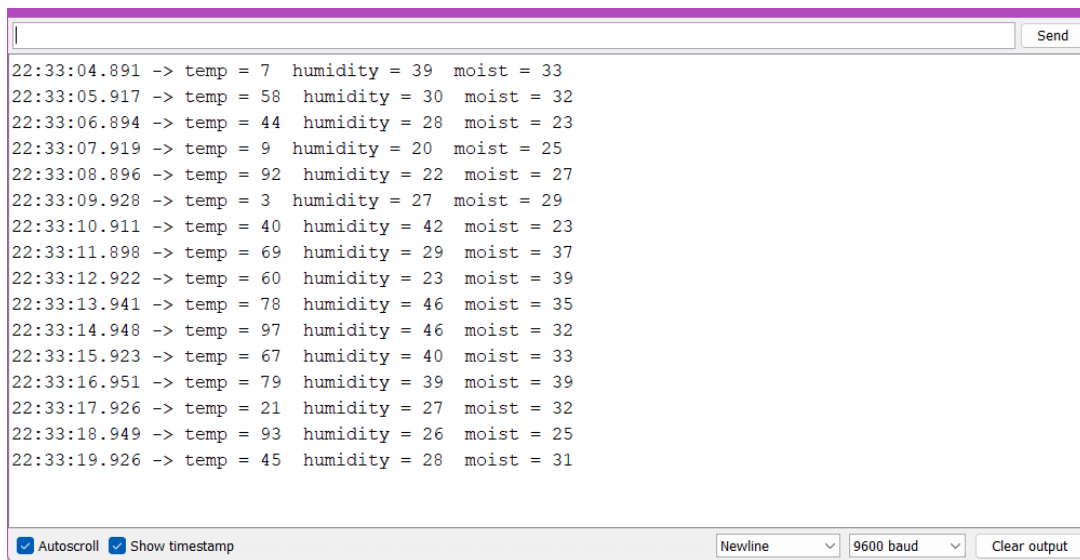

mySerial.begin(9600);delay(15000); Serial.begin(9600); delay(1000); Serial.print("\r");
delay(1000);

Serial.print((String)"update-
>"+(String)"Temperature="+t+(String)"Humidity="+h+(String
)"Moisture="+m);delay(1000);
}

}

```

## Output

The screenshot shows a serial monitor window with a text area displaying 18 lines of sensor data. Each line starts with a timestamp in the format HH:MM:SS.mmm followed by an arrow and three space-separated values: temp, humidity, and moist. The data values vary across the lines. At the bottom of the window, there are checkboxes for 'Autoscroll' and 'Show timestamp', both of which are checked. To the right of these checkboxes are dropdown menus for 'Newline' and '9600 baud', and a 'Clear output' button.

```

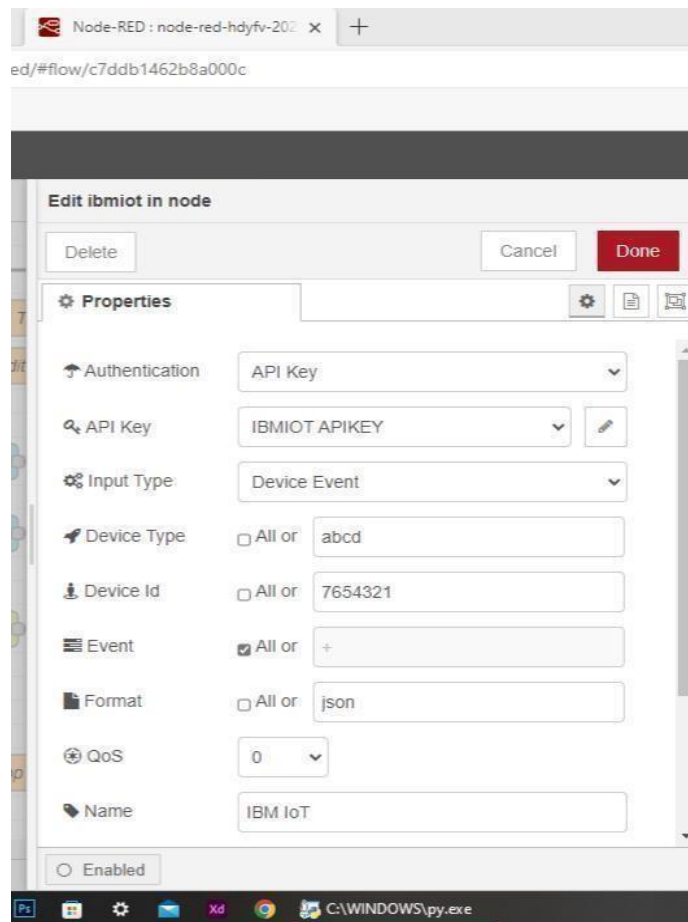

22:33:04.891 -> temp = 7  humidity = 39  moist = 33
22:33:05.917 -> temp = 58  humidity = 30  moist = 32
22:33:06.894 -> temp = 44  humidity = 28  moist = 23
22:33:07.919 -> temp = 9  humidity = 20  moist = 25
22:33:08.896 -> temp = 92  humidity = 22  moist = 27
22:33:09.928 -> temp = 3  humidity = 27  moist = 29
22:33:10.911 -> temp = 40  humidity = 42  moist = 23
22:33:11.898 -> temp = 69  humidity = 29  moist = 37
22:33:12.922 -> temp = 60  humidity = 23  moist = 39
22:33:13.941 -> temp = 78  humidity = 46  moist = 35
22:33:14.948 -> temp = 97  humidity = 46  moist = 32
22:33:15.923 -> temp = 67  humidity = 40  moist = 33
22:33:16.951 -> temp = 79  humidity = 39  moist = 39
22:33:17.926 -> temp = 21  humidity = 27  moist = 32
22:33:18.949 -> temp = 93  humidity = 26  moist = 25
22:33:19.926 -> temp = 45  humidity = 28  moist = 31

```

## 7.2 Feature – 2

### Configuration of Node-Red to send commands to IBM cloud

IbmIoT node I used to send data from Node-Red to IBM Watson device. So, after adding it to the flow we need to configure it with credentials of our Watson device.

Here we add two buttons in UI

1 -> for motor on

2 -> for motor off

We used a function node to analyse the data received and assign command to each number.

The Java script code for the analyses is:

```
if(msg.payload===1)
```

```
msg.payload={"command":
```

```
"ON"}; else if(msg.payload===0)
```

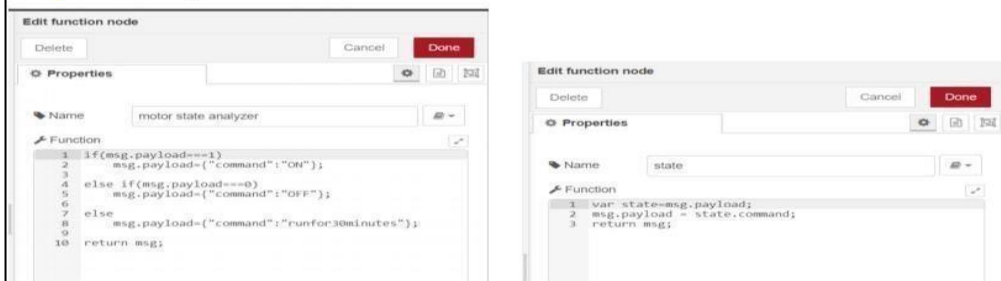

```
msg.payload={"command":
```

```
"OFF"};
```

Then we use another function node to parse the data and get the command and represent it visually with text node.

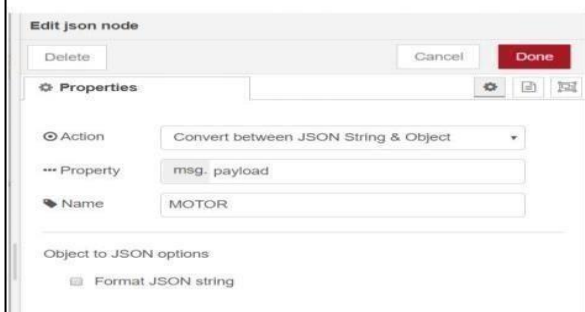

The Java script code for that function node is:

```
var state=msg.payload;  
msg.payload = state.command;  
return msg;
```

The above images show the java script codes of analyser and state function nodes.

Then we add edit json node to the conversion between JSON string & object and finally connect it to IBM IoT Out.

Edit JSON node needs to be configured like this

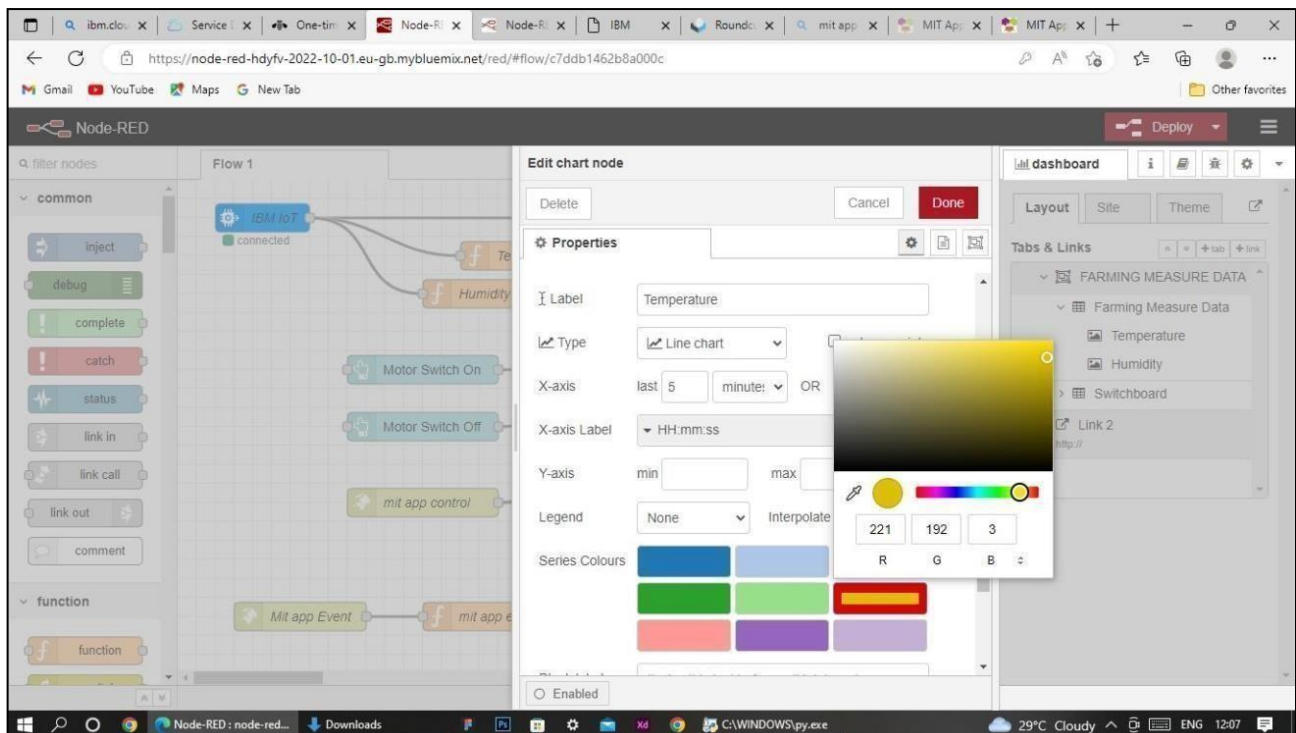

This is the program flow for sending commands to IBM cloud.

## Adjusting User Interface

In order to display the parsed JSON data a Node-Red dashboard is created

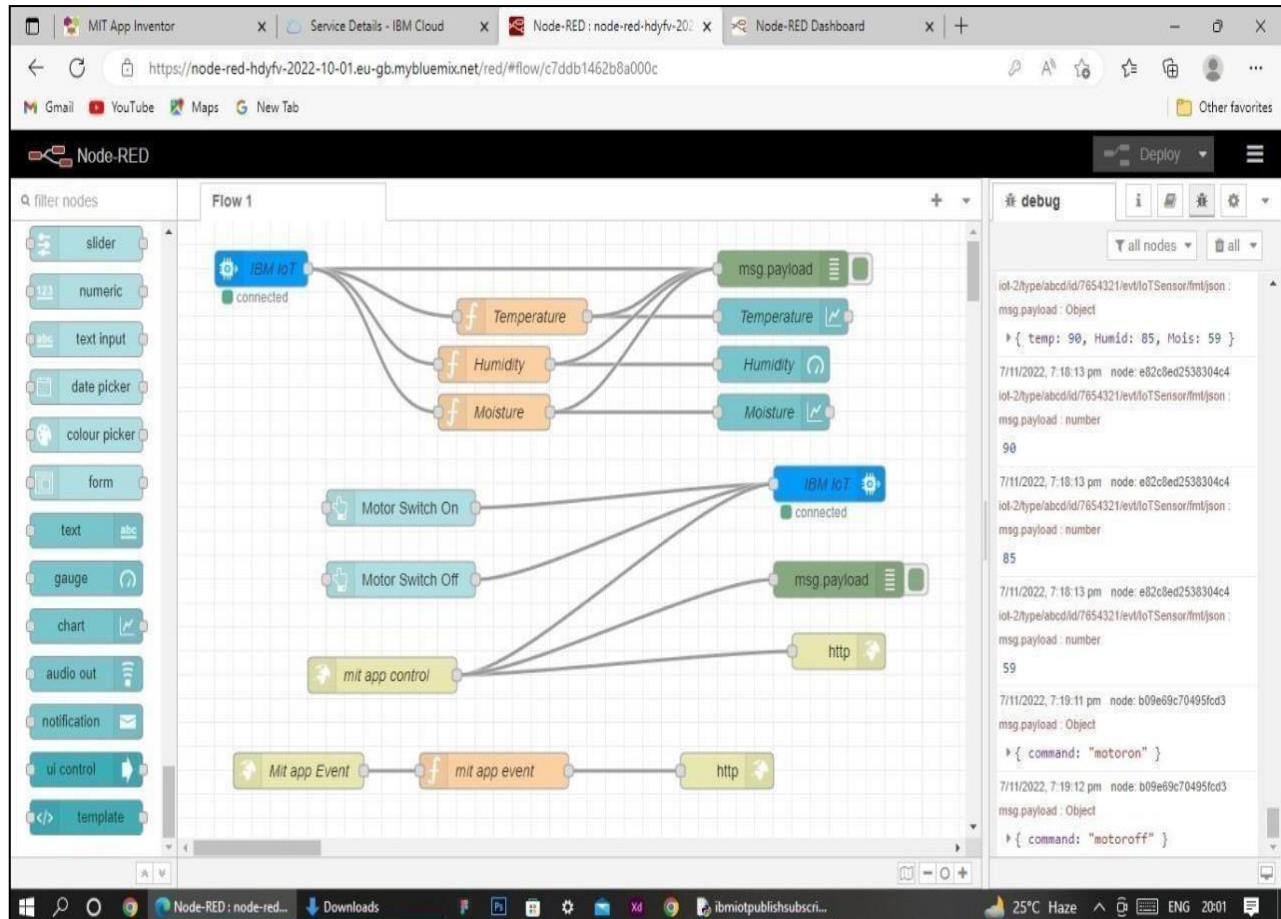

Here we are using Gauges, text and button nodes to display in the UI and helps to monitor the parameters and control the farm equipment.

Below images are the Gauge, text and button node configurations.

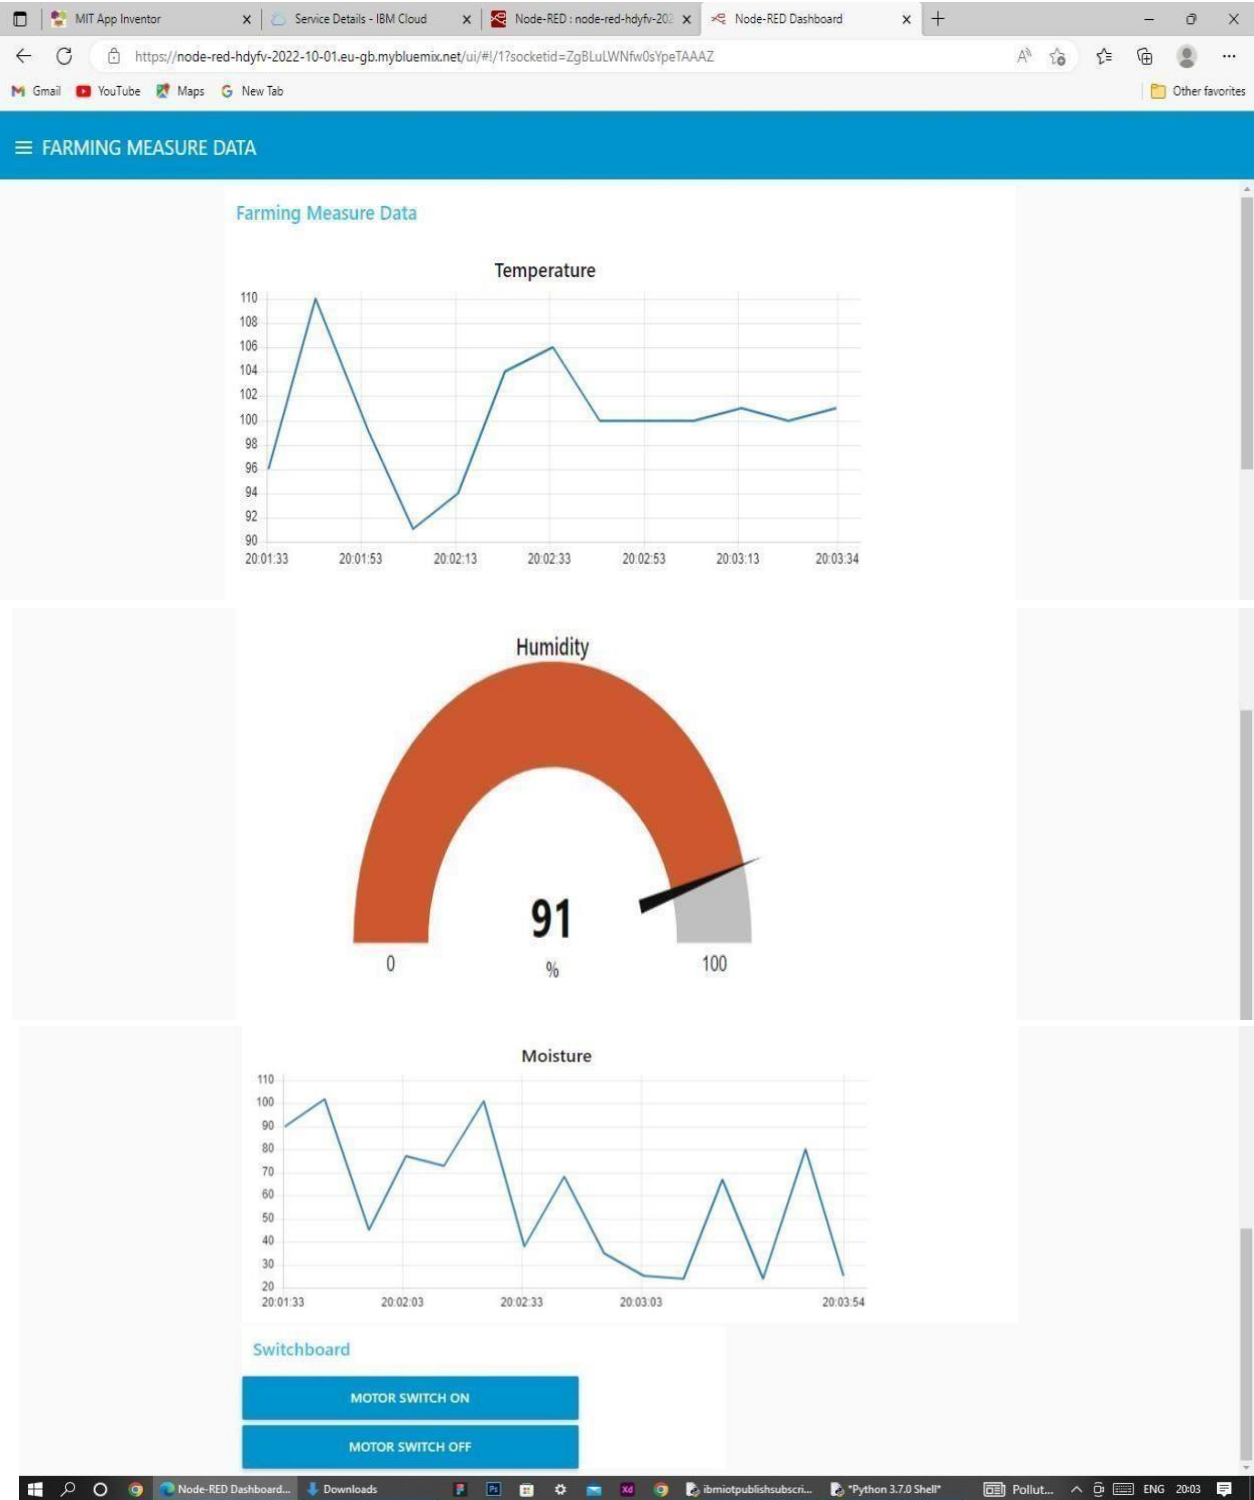

# Complete Program Flow

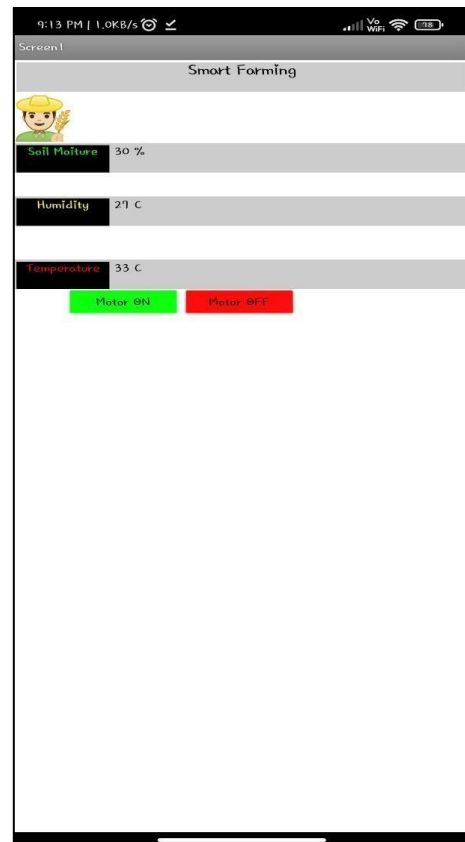

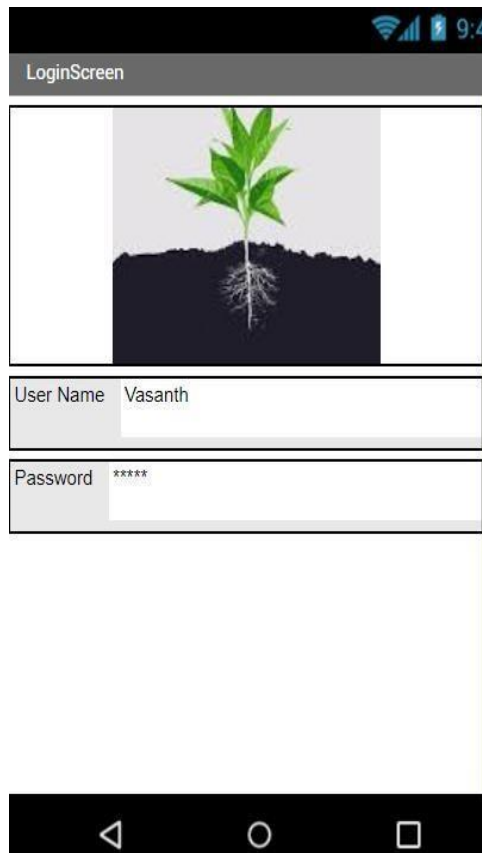

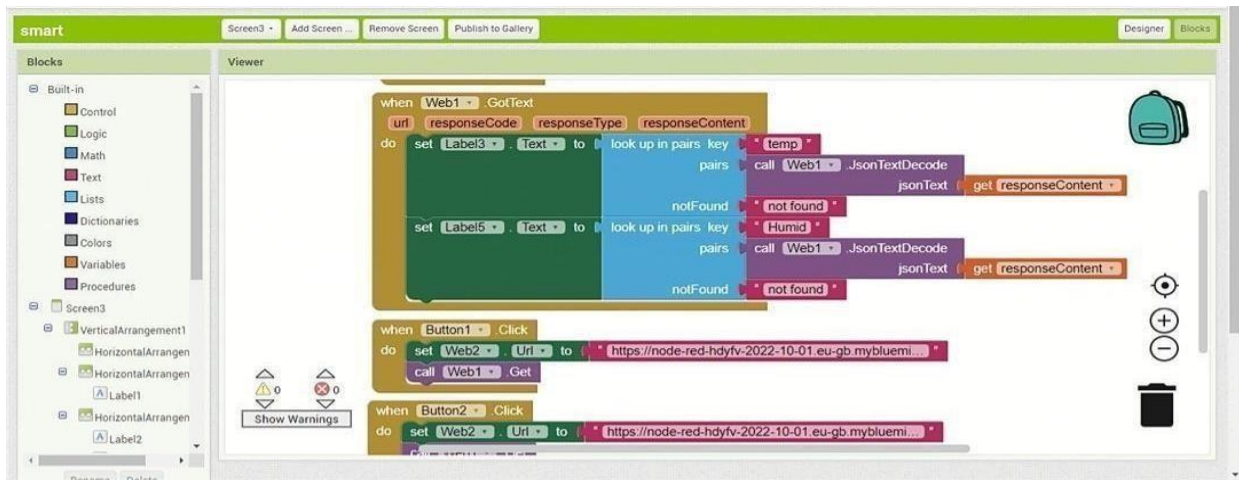

# Web APP UI Home Tab

# Mobile App UI

## SMART FARMER APPLICATION

## 8.2 User Acceptance Testing

### 1. Purpose of Document

The purpose of this document is to briefly explain the test coverage and open issues of the [ProductName] project at the time of the release to User Acceptance Testing (UAT).

Increasing control over production leads to **better cost management and waste reduction**. The ability to trace anomalies in crop growth or livestock health, for instance, helps eliminate the risk of losing yields. Additionally, automation boosts efficiency. Smart farming **reduces the ecological footprint of farming**. Minimized or site-specific application of inputs, such as fertilizers and pesticides, in precision agriculture systems will mitigate leaching problems as well as the emission of greenhouse gases.

### 2. Defect Analysis

This report shows the number of resolved or closed bugs at each severity level, and how they were resolved

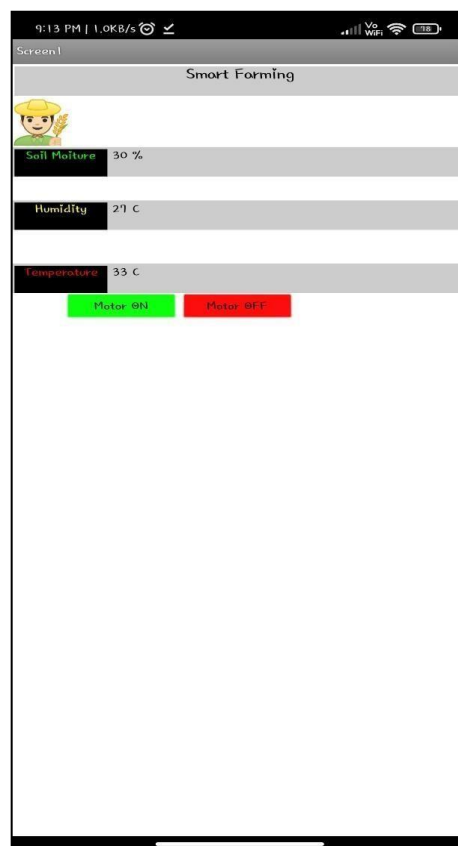

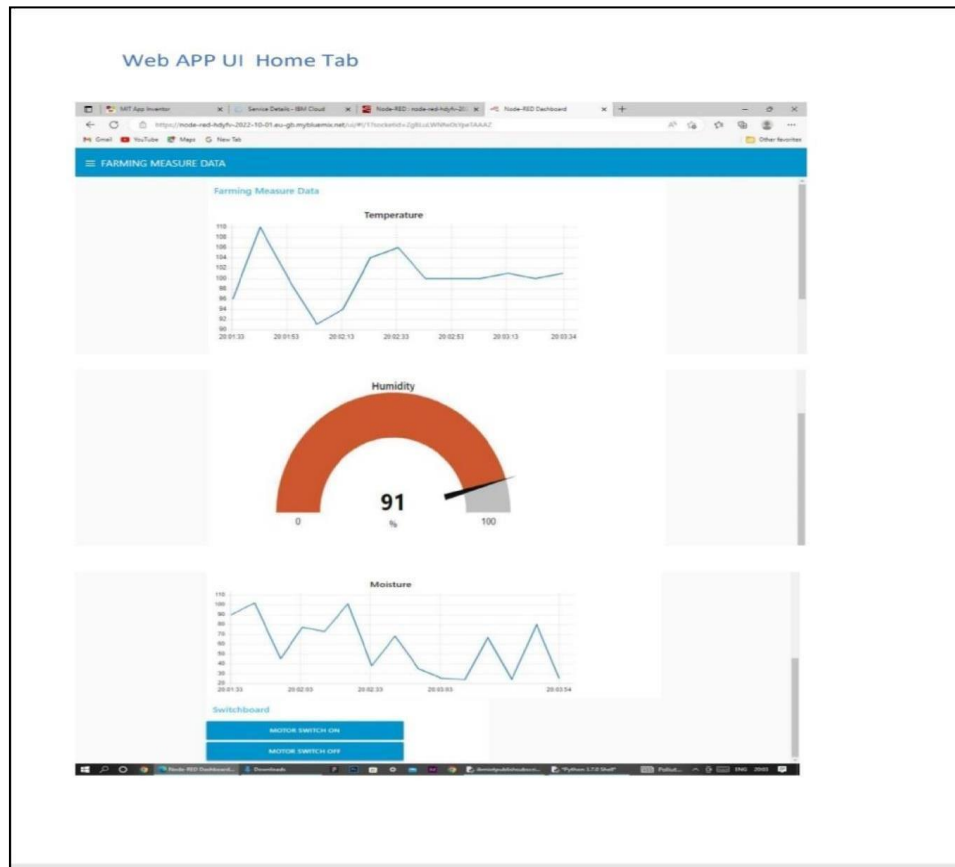

| Resolution     | Severity 1 | Severity 2 | Severity 3 | Severity 4 | Subtotal |
|----------------|------------|------------|------------|------------|----------|
| By Design      | 8          | 3          | 2          | 2          | 16       |
| Duplicate      | 1          | 0          | 2          | 0          | 3        |
| External       | 2          | 3          | 0          | 1          | 6        |
| Fixed          | 9          | 2          | 3          | 17         | 31       |
| Not Reproduced | 0          | 0          | 1          | 0          | 1        |
| Skipped        | 0          | 0          | 1          | 1          | 2        |
| Won't Fix      | 1          | 4          | 1          | 1          | 7        |
| Totals         | 21         | 12         | 9          | 22         | 66       |

### 3. Test Case Analysis

This report shows the number of test cases that have passed, failed, and untested

| Section             | Total Cases | Not Tested | Fail | Pass |
|---------------------|-------------|------------|------|------|
| Print Engine        | 5           | 0          | 0    | 5    |
| Client Application  | 30          | 0          | 0    | 30   |

# 9. Result

## **10. Advantages & Disadvantages**

### **Advantages:**

- Farms can be monitored and controlled remotely.
- Increase in convenience to farmers.
- Less labor cost.
- Better standards of living.

### **Disadvantages:**

- Lack of internet/connectivity issues.
- Added cost of internet and internet gateway infrastructure.
- Farmers wanted to adapt the use of WebApp.

## **11. Conclusion**

An IoT-based SMART FARMING SYSTEM for live monitoring of temperature, humidity and soil moisture is proposed using Arduino and cloud computing. The system has high efficiency and accuracy in acquiring live temperature and soil moisture data. The IoT-based smart farming system proposed in this report constantly assists farmers by providing accurate live feeds of ambient temperature and soil moisture for over 99 curated results, thus enabling farmers to increase their agricultural yields and help manage food production efficiently.

## **12. Future Scope**

By collecting data from Sensor with IoT devices, we can learn about the “real state” of Crops. In future, IoT system in agriculture enables predictive analytics and helps you make better harvest decisions. It is important to use the latest information and communication technology to manage the family in order to improve the quantity and quality of products while optimizing the human labor force. In between Technologies available for today's glory: Soil, water, light, humidity and temperature control. Small Agricultural Products are designed to support field monitoring through the automation of automation systems using Sensors. As a result, Fame and associated volumes can easily monitor field conditions from anywhere.
